

Area of Potential Effect

The Area of Potential Effect (APE) for the project includes all of Lincoln Park as well as adjacent properties in the vicinity of the improvements where there might be a visual effect.

The approximately 37-acre park is long and narrow, following Miller Creek as it cascades down a steep slope, dropping from an elevation of about 1,000 feet to 650. The creek enters the park at West Skyline Parkway and runs in a southeasterly direction to the park's terminus at West 3rd Street. North 24th Avenue West and North 25th Avenue West edge most of the park's northeastern border. North 25th Avenue West also forms some of the park's southwestern border along with Lincoln Park Drive, West 10th Street, Lincoln Parkway, and North 26th Avenue West. Some private property is on the park side of these roads, and private property directly abuts the park in other locations.

This map illustrates the park's steep topography. (Saint Louis County Land Explorer app)

The APE illustrated above, includes areas that will be physically affected by the project or might be subject to indirect visual effects. The park as a whole (left) is also in the APE. (Above, Saint Louis County Land Explorer app; left: Google map)
